E-BOOK MS

Hello, this book will give you the best concepts you rely on.
Concepts I have known in all books and concepts that I present to you are very important
I shorten everything inside these books for you by adding new patterns

"Trendlines"

@MST_770

Market moves are never random - they go in certain directions. A trendline is one of the main tools to see that movement and trade with it. This part will teach you:

- How to spot the price direction
- How to find good entries that match the trend
- How to catch early trend reversals

Now let's look together at how to draw a trendline and how to use it.

Bearish trendline"

Bullish trendline

• The lesson :

SMC

"SMC"

Smart Money Consist

"In this series, I will teach you only the most important parts of SMC.
No useless theory - only what really works!

My goal is to help you see the market like a professional
and take precise entries and exits!"

SMC

HH (Higher High)

HL (Higher Low)

LH (Lower High)

LL (Lower Low)

BOS (Break of Structure)

CHOCH (Change of Character)

Note ⚠

The structure shown in this image is classic SMC theory.
We don't use it exactly as it is - instead, we combine it with our own strategy.
. So, take this theory only as a foundation to understand market structure,
but my real analysis and entries will look different.
We will learn this in more detail in the next lesson

Summary SMC:

- * HH & HL → Uptrend signs
- * LH & LL → Downtrend signs
- * BOS → Trend continuation
- * CHOCH → Trend reversal

SMC

Inducement

is a form of "magnet" liquidity in the market that attracts traders to open or close their positions. Often, traders misinterpret these signals and lose their stops because of these inducements.

In other words, inducement is a tactic used to draw large positions or liquidity in the market, and inexperienced traders often fall for these moves and take losses.

Let's take a look"

"LS" means Liquidity Sweep.
In SMC, they usually call this BOS,
but we call it Liquidity Sweep.

BO" means Break of Structure,
which shows that the market

structure has changed. In SMC, they
call it "Cho'ch", but we call it "BO

IRL" means "Internal Range Liquidity"
which is also called "Inducement

This is how SMC traders view the market.
Many SMC traders only look at (LS) and (BOS)
when entering a trade. They do not consider
inducement. But this point is actually
internal liquidity - inducement.
The market first moves to this area,
collects stop-losses,
and then continues in the main direction.

On this side, you can see how classic traders
view the market—they enter trades
only based on BOS and a simple retest.
But the problem is that their entry point
is actually where liquidity is collected
(where stop-losses are placed).
That's why the market often takes their
stops first and then moves in the main direction

Attention ⚠️

Every POI (Point of Interest) must be preceded by inducement.
Inducement is a move that draws liquidity — acting as a "trap" before the real entry.
Without inducement, the POI level is likely to fail.
Therefore, always analyze the structure carefully before entering.
Only then can you ensure high-probability and safe entries.

Trend Continuation and Inducement

Inducement is the move that attracts liquidity and drives the market toward the POI. Without inducement, the POI may fail and the trend can break. That's why inducement is a must for a high-quality entry. Once inducement is cleared, the market reacts from the POI and continues in the main trend direction.

Bullish trend

Entry time frame

D1 (POi) > entry H4,H1

H4 (POi) > entry M15,M5

H1 (POi) > entry M5,M1

M15 (POi) > entry M

1D

We will give some examples of MSNR +LIT+SMC+ and how the frames are related
 $POI(D1) > entry H4+H1$

1H

We change the line to show the MSNR areas more clearly

MST

" ICT KILL ZONE "

"What we will learn in ICT"! 

• Asia Range

- The Asia session is the calm period of the market with low volatility.
 - Time : 01:00 - 05:00 London Time (UTC +1)
 - During this time, price usually moves sideways, creating a liquidity zone for the next sessions.
-

• Purpose of the Asia Range?

- Price consolidates during this period.
- The boundaries of this consolidation (high/low) are used for breakouts or false breakouts in the next sessions.
- If price breaks the Asia high/low and confirms it
 - the trend may continue .
- If price breaks the Asia high/low and then reverses back
 - this can be a signal of a trend reversal.

• The concept of Asian babysitter

- During the Asian session (Asia Range), the high and low points are formed - these levels represent liquidity.
 - During London or New York sessions, these Asia high/low levels are often taken out (liquidity grab) before the main move starts
-

✓ In this chart :

- Asia Range - area where liquidity is accumulated.

📍 POI (Point of Interest) - key zone where price may react.

📈 Expectation - after taking Asia low, a new impulsive move is expected from the POI.

• "Asia Session Breakout + Fibo"

- The breakout happens before the Asia session starts or during the Asia session.
- After the Asia session ends, we draw Fibonacci from Asia low to Asia high and consider the 0.33 - 0.5 zones as POI.
- Once price retraces to this zone, we wait for confirmation before entering a trade.

Q2 - Apr - Jun	Q2 - week 2	Q2 - Tuesday	Q2 - London
Q3 - Jul - Sep	Q3 - week 3	Q3 - Wednesday	Q3 - New York (am)
Q4 - Oct - Dec	Q4 - week 4	Q4 - Thursday	Q4 - New York (pm)

Micro cycle (90 minutes)

Asia:	London:	New York (am)	New York (pm)
Q1 - 00:00 - 1:30	Q1 - 6:30 - 7:30	Q1 - 12:00 - 13:30	Q1 - 18:00 - 19:30
Q2 - 1:30 - 3:00	Q2 - 7:30 - 9:00	Q2 - 13:30 - 15:00	Q2 - 19:30 - 21:00
Q3 - 3:00 - 4:30	Q3 - 9:00 - 10:30	Q3 - 15:00 - 16:30	Q3 - 21:00 - 22:30
Q4 - 4:30 - 6:00	Q4 - 10:30 - 12:00	Q4 - 16:30 - 18:00	Q4 - 22:30 - 00:00

Trading Based on Quarterly Theory:

We mainly trade on the Daily and Micro Cycle (90-minute) timeframes.

Each day is divided into 4 phases:

📌 Q1 - Asia session • 📌 Q2 - London session • 📌 Q3 - New York (AM) • 📌 Q4 - New York (PM)

 These phases represent: Accumulation (Q1), Manipulation (Q2), Distribution (Q3), and Reversal/Continuation (Q4).

If we correctly identify the time and analyze price movement according to these phases, it becomes much easier to find optimal entry and exit points

"Quaterly theory"

The image presents a schematic representation of trend changes and movements based on the "QT" across trading sessions.

In the Asia session, the price consolidates (A); the London session brings manipulation (M), often leading to a trend reversal.

The New York session corresponds to the main movement phase (D or X),

during which the price moves sharply in its intended direction.

⚠ This pattern is crucial for understanding

"Smart money technique"

SMT Divergence

• Gold (XAUUSD) and Silver (XAGUSD) almost always move in the same direction. They are correlated. But sometimes they differ from each other - this difference is what we call SMT Divergence.

• For example, Gold takes the liquidity from the lows, but Silver does not take the liquidity at the same level and reverses. This means that Gold only took out traders' stop-losses, but the real trend is on Silver's side.

• If XAU takes liquidity while XAG does not. If XAG takes liquidity while XAU does not → the direction is on XAG's side.

→

the direction is on XAU's side.

Important information, this concept is an auxiliary factor in analysis

If it is found during entry, the probability of success of the transaction increases

SMT only occurs if there is a price reversal

Divergence pairs :

XAUUSD - XAGUSD
EURUSD - GBPUSD
AUDUSD - NZDUSD
EURJPY - GBPJPY
AUDJPY - NZDJPY
EURCAD - NZDCAD
USDCAD - USDCHF

Let's see together the shape of SMT and some examples

• The lesson :

L I T

"L i q u i d i t y"

We previously studied liquidity with the SMC concept

But this lesson is completely different

We learn what liquidity is, otherwise how many sections are divided?

What is liquidity?

In short, liquidity is what is in the market, it is as fuel for the market

If you find that there are strong movements.

Liquidity varies from one pair to another and from one trading session to another.

There is a possibility of high-price liquidity that cannot be penetrated and there are low liquidity places that we can target.

We just have to predict the price movement towards the right liquidity and move with it

Liquidity sections?

Liquidity is divided into two types, internal liquidity and external liquidity

Internal liquidity:

Internal liquidity is formed after the

explosion of the price, except for an upward or downward trend, leaving behind lows, or small peaks, price gaps, and supply and demand areas.

External liquidity

External liquidity is clear who hears it

It is at the tops or bottoms, targeted by the price when it likes enough internal liquidity

We remembered that liquidity works as fuel, this means that the price moves from

Internal liquidity of external liquidity and vice versa

Internal liquidity

The most frequent forms

External liquidity

F I B O F i b o n a c c i

What is Fibonacci?

 Fibonacci are mathematical engineering tools, innovative from mathematical and physical laws

The goods may not know that everything in this modesty has a golden percentage, which is Fibonacci,

even the market, we may find golden ratios in it, these tools help us to get The best areas

Types of Fibonacci?

There are many types of Fibonacci

It is used in many forms, including measuring distance and some of them to measure time

Important information You can't rely on Fibonacci alone with its strength number

We only use Fibonacci to filter areas and extract

The best areas to enter into a deal

F I B O F i b o n a c c i

 We will study three types of Fibonacci, which are the most important
