@I_Am_The_ICT

Wait for Manipulation & Trade the distribution

- In ICT terms -Every candle has its own po3.
- With respect to HTF PD arrays Look for H4 or H1 manipulation candle forming at specific time of the day.(**1-5-9am & 2 - 6 - 10am EST**)
- Wait for candle to Sweep the high/low of the Accumulation candle/ Range with respect to HTF PDA, and then it must close inside the range at the specific time and then trade the next candle & for entries in LTF -Model 1 or Model 2.
- 1hr time frame -High probability manipulation at 1-3am, 6-7am & 9-10am EST.
- Wait for manipulation/ purge / TS then trade the next candle.

***Everything I mentioned here is UTC -4**

PO3 / AMD

1. Before looking the Entry formation one should confirm the higher time frame bias.
2. Below or above the Manipulation candle there should be a Order Block / Breaker block / Mitigation block/ FVG/ Old high or lows.
3. HTF premium / discount should be considered. Prefer the LRLR for High probability

TIME FRAME ALIGNMENTS

HTF

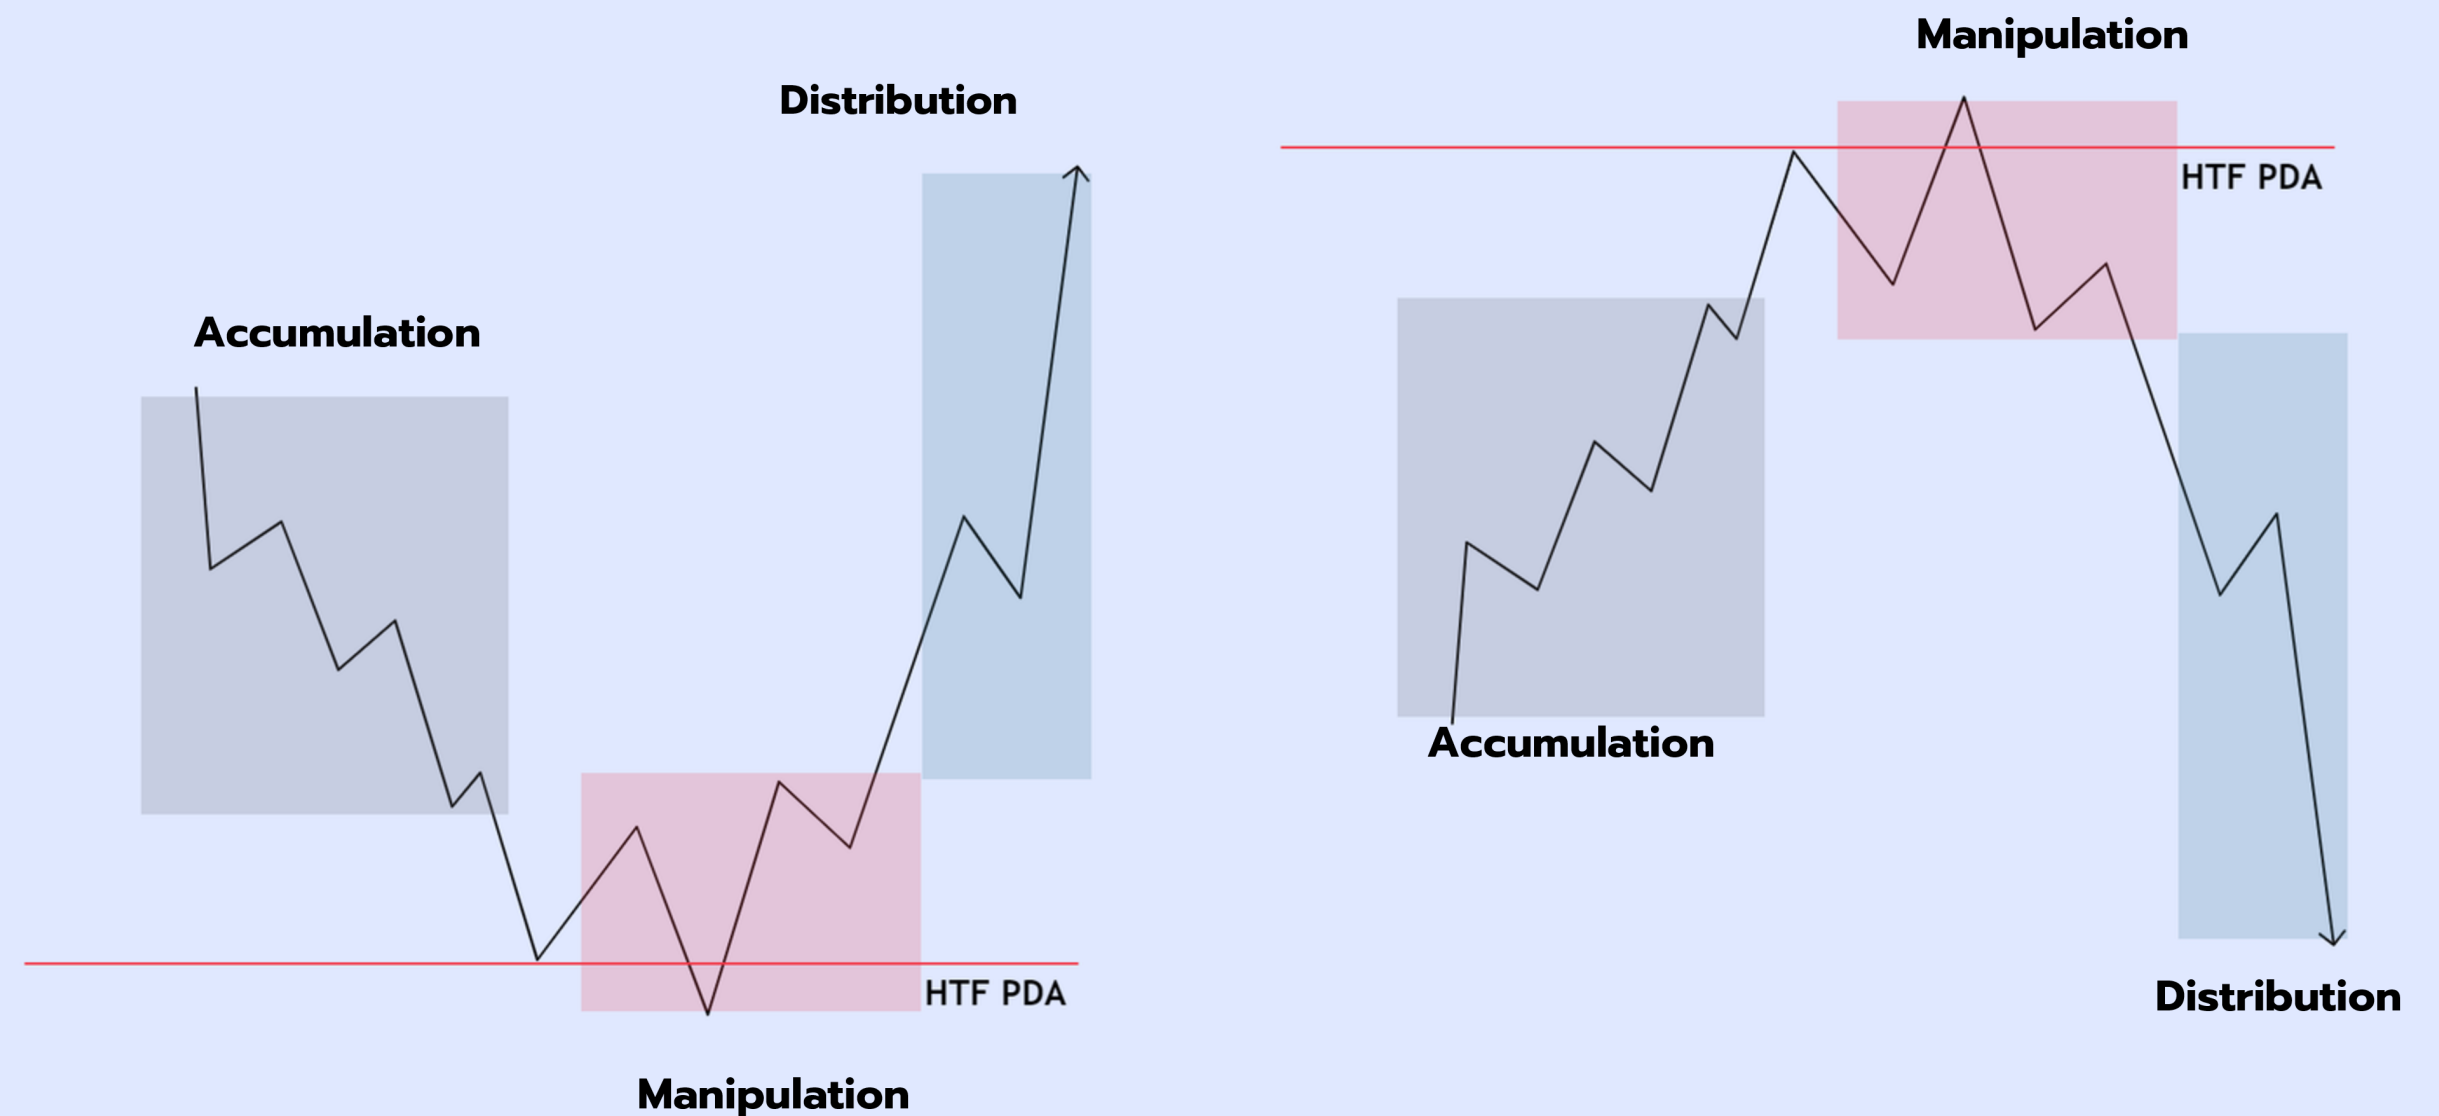

LTF

4HR

15MIN

1HR

5MIN

TIME & PRICE

- Price is useless until time is considered.
 - There is no use of time without price levels.
 - By considering both the time and price at a point the result will be tremendous.
-

Key timing for Manipulation and Distribution

FOREX

4hr timeframe -1am,5am & 9am EST (If **5am** h4 is a manipulation candle, then trade the **9am** Distribution candle)

1hr timeframe - around 1-3am,6-7am & 9-10am EST(**high probable**)

INDEX FUTURES

4HR TF- 2am,6am & 10am EST

1HR TF - 9-10am,10-11am

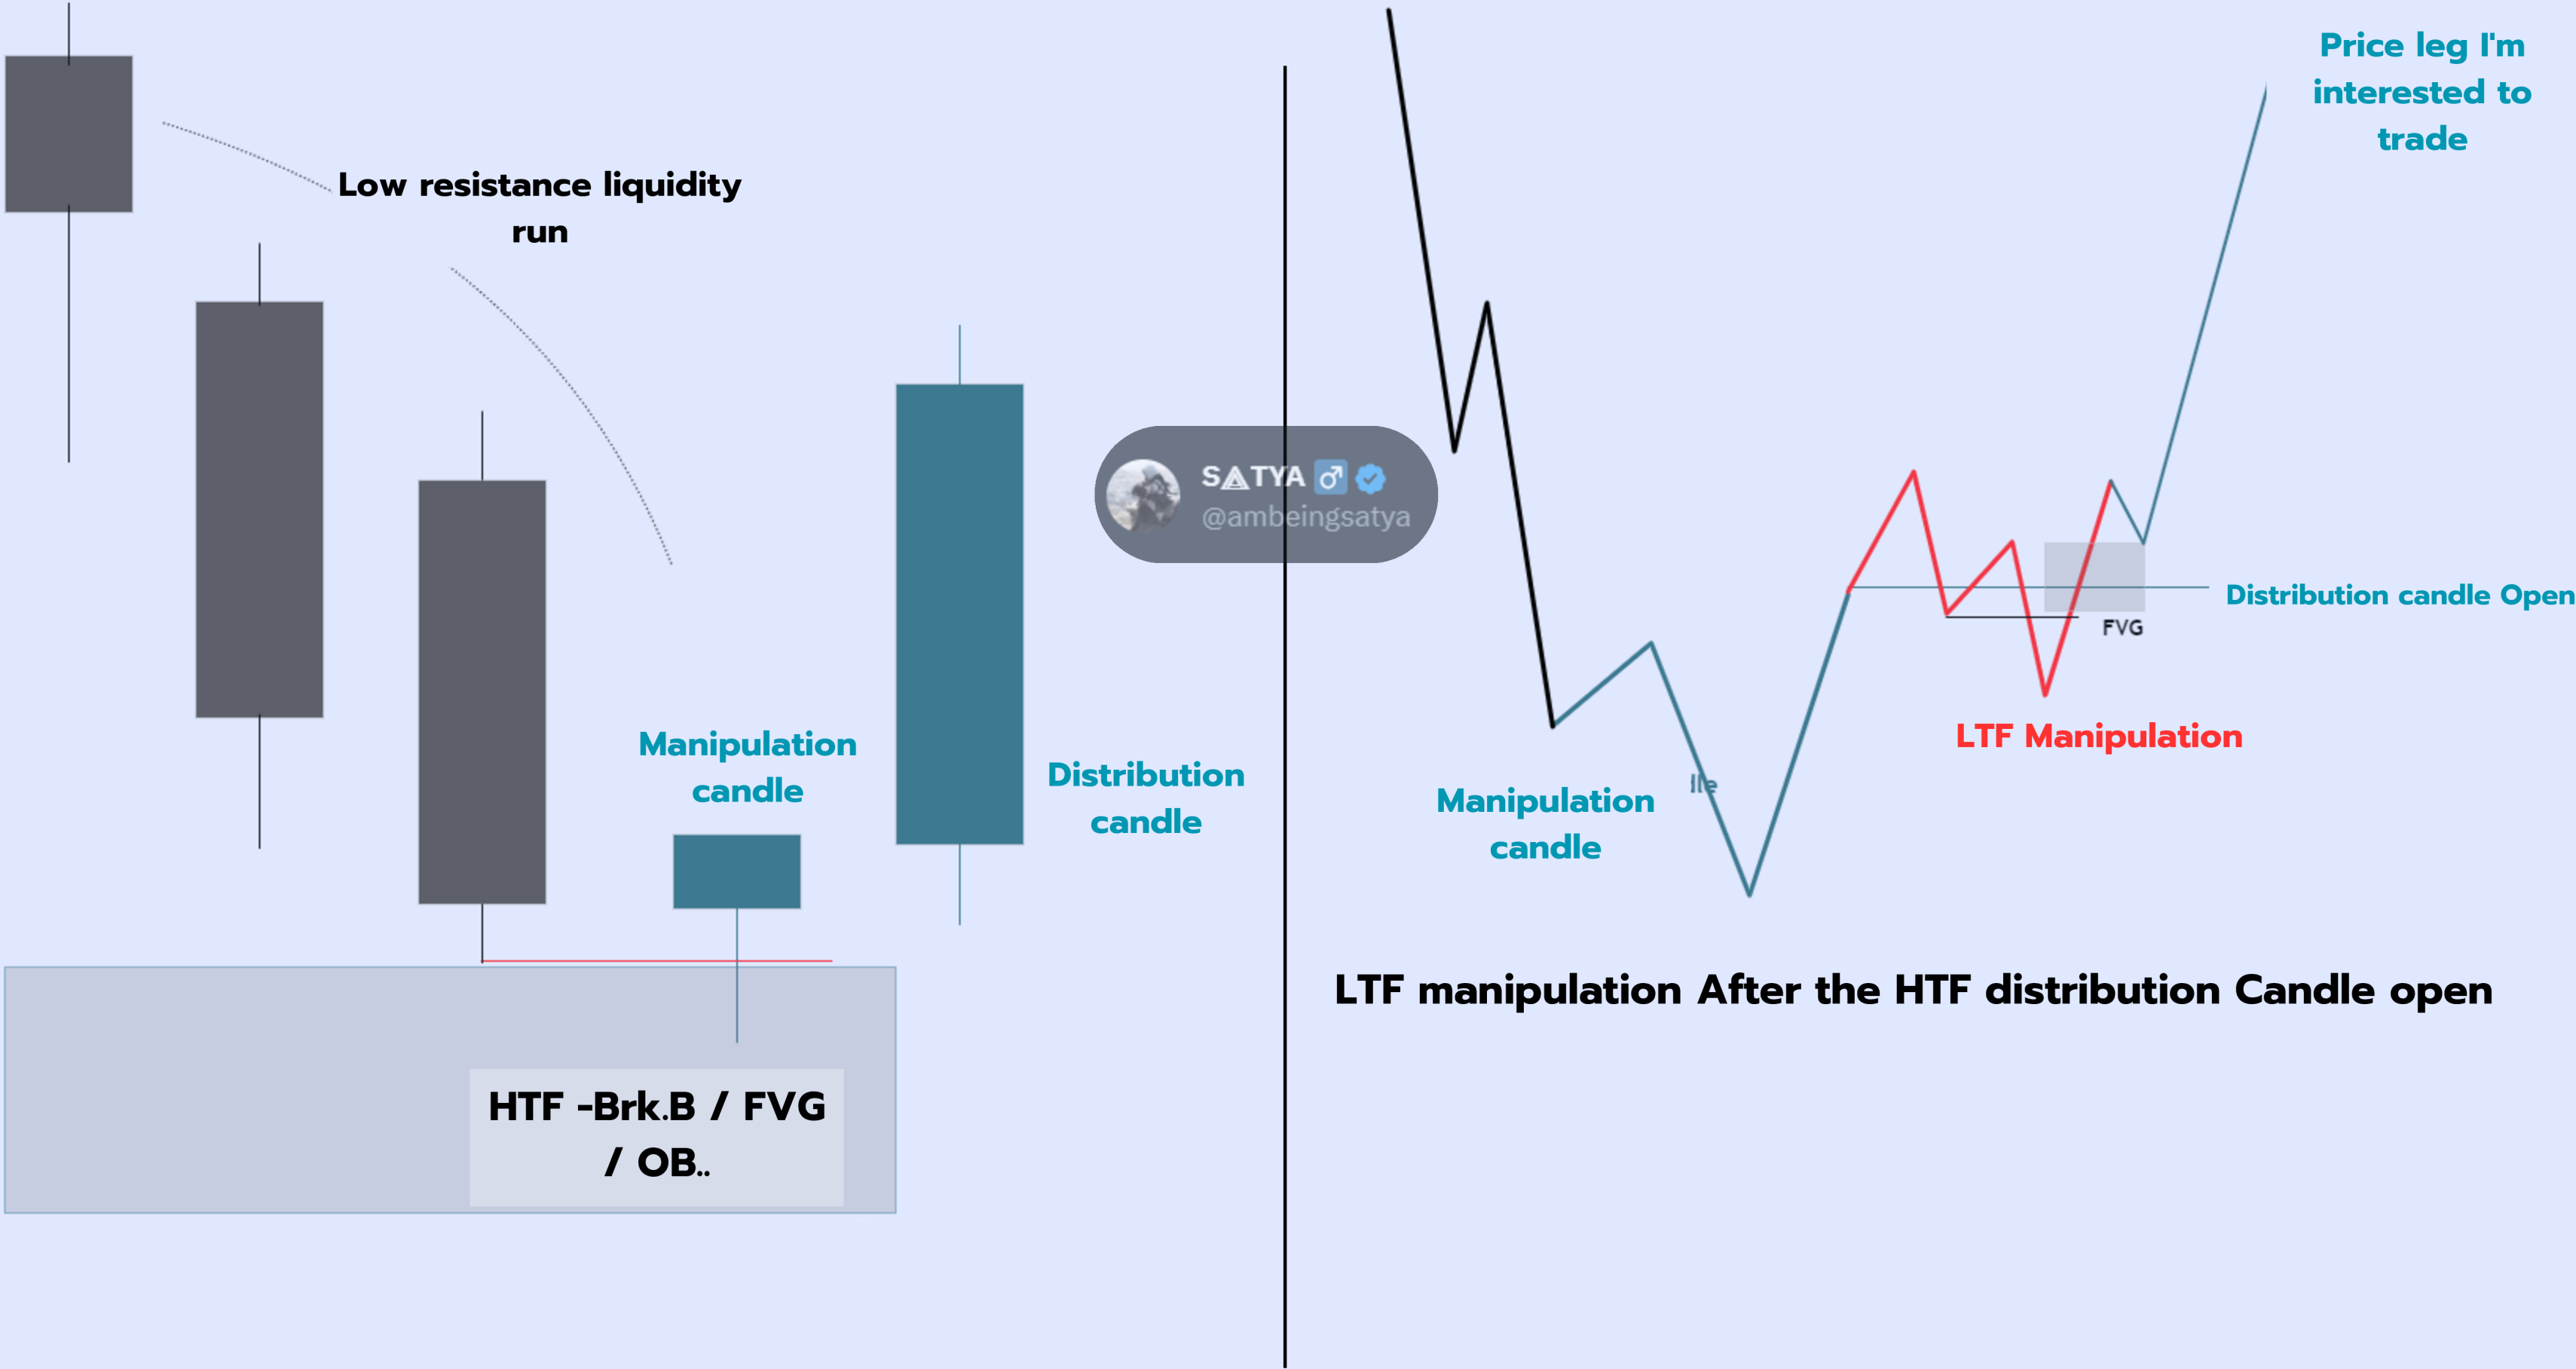

(Better to trade after the 9:30 am equity open)

- 1.I used to trade the NQ= 1 min macros (**XX:20-XX:40 & XX: 50- XX:10**)
- 2.Instead of 15m I use 5min & For 5min I use 1min(**for NQ**)
- 3.No pm session entries

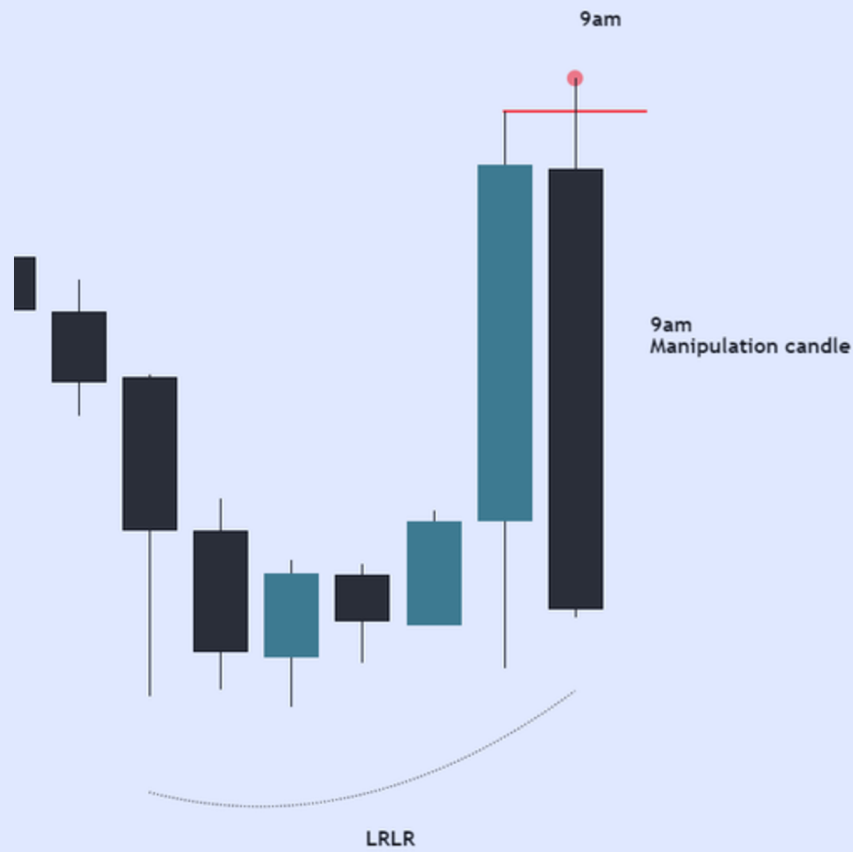

***Everything I mentioned here is UTC -4**

Model 1

Example NQ:- Model 1

6/9/2024
NQ1! | 60M

HTF manipulation candle

- With respect to PDA, There is an H1 manipulation candle at 9am
- We can expect the next 10 am candle to be Distribution candle as there is no opposing FVG/PDA

6/9/2024
NQ1! | 1M

- After 10 am H1 open, down to the LTF 1min
- (only 1min ltf is recommended to NQ, because of volatility)

6/9/2024
NQ1! | 1M

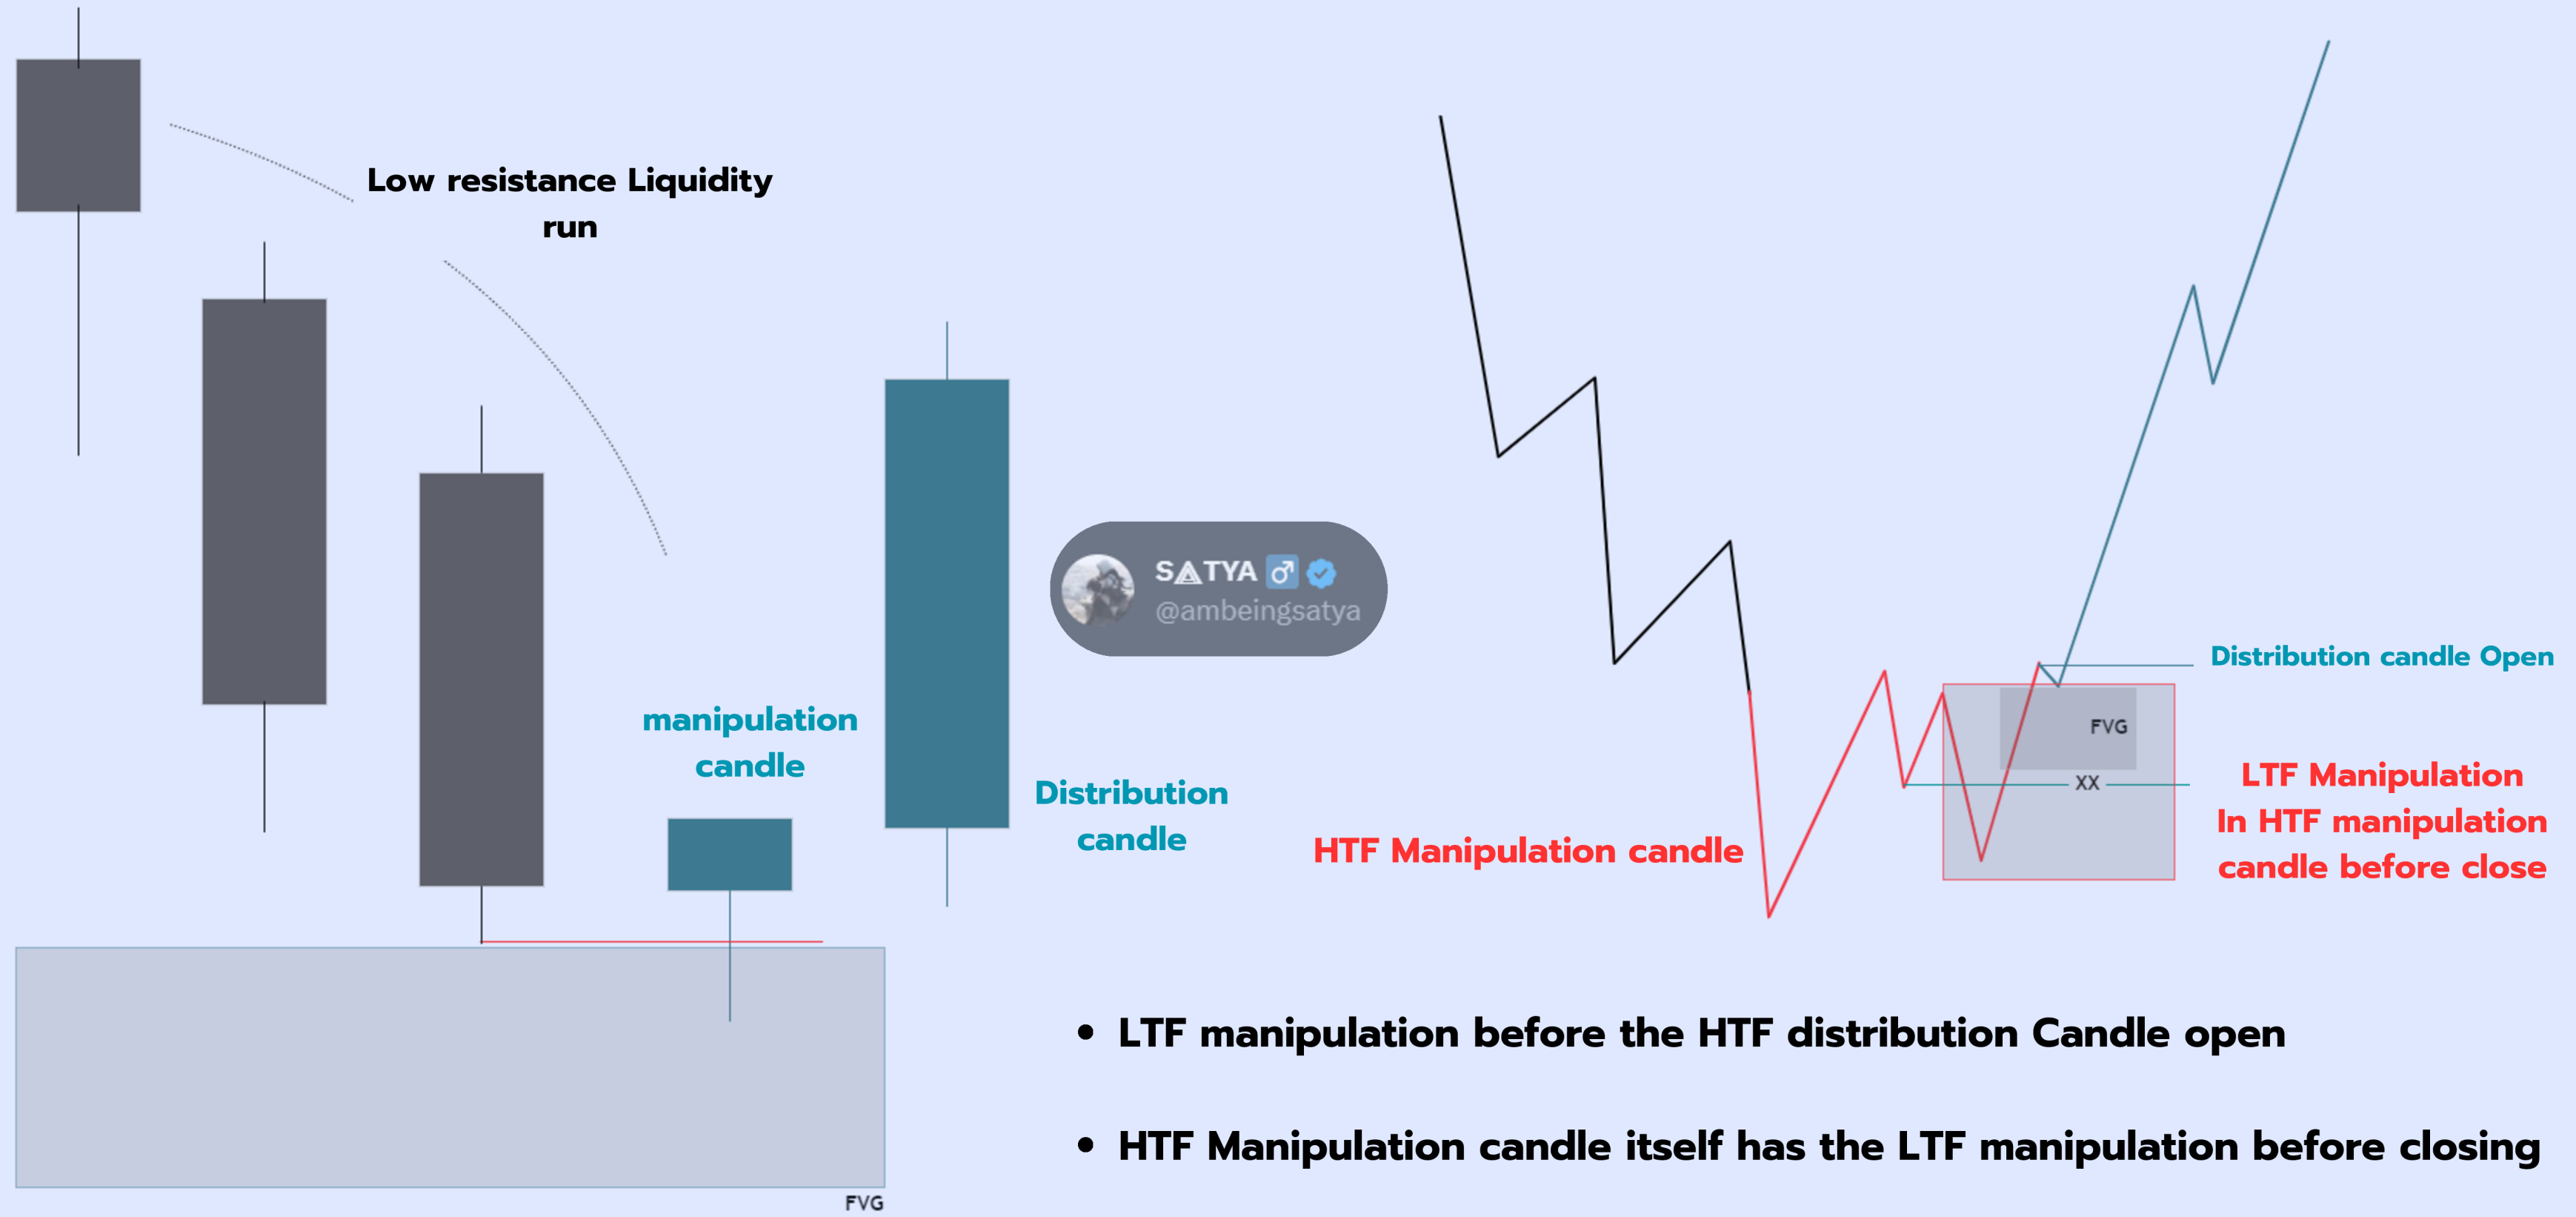

- There is Liq sweep/ AMD happens and forms FVG
- After FVG plan your 1:2 RR trade, entry & sl as shown above

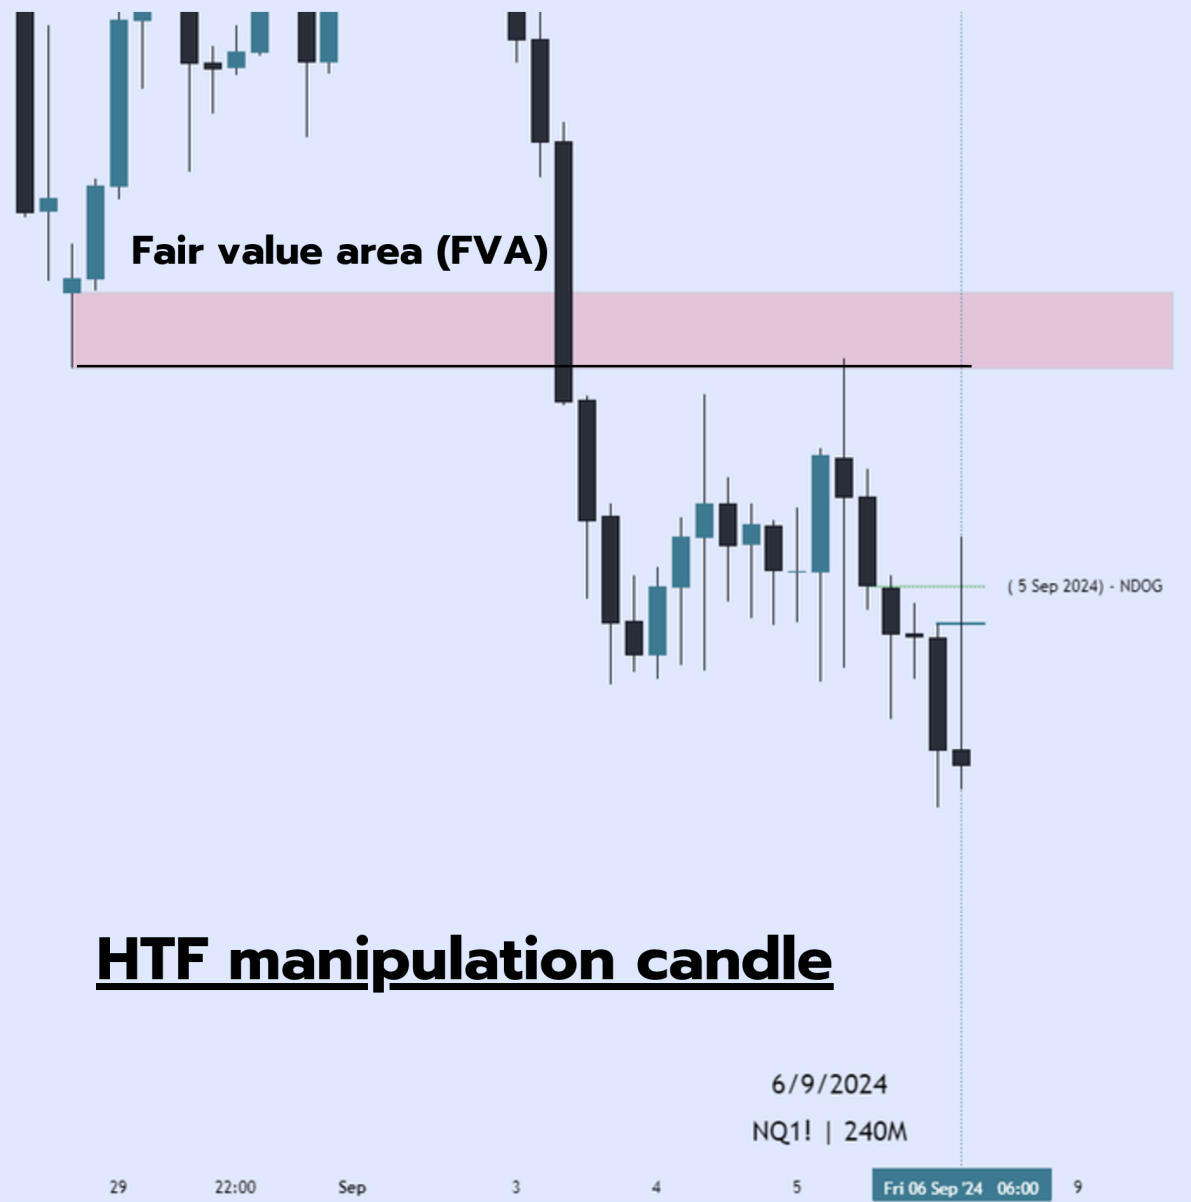

6/9/2024
NQ1! | 1M

- Without FVG or liq Sweep its a low probable trade
- 1min scalping is only recommended for US index.

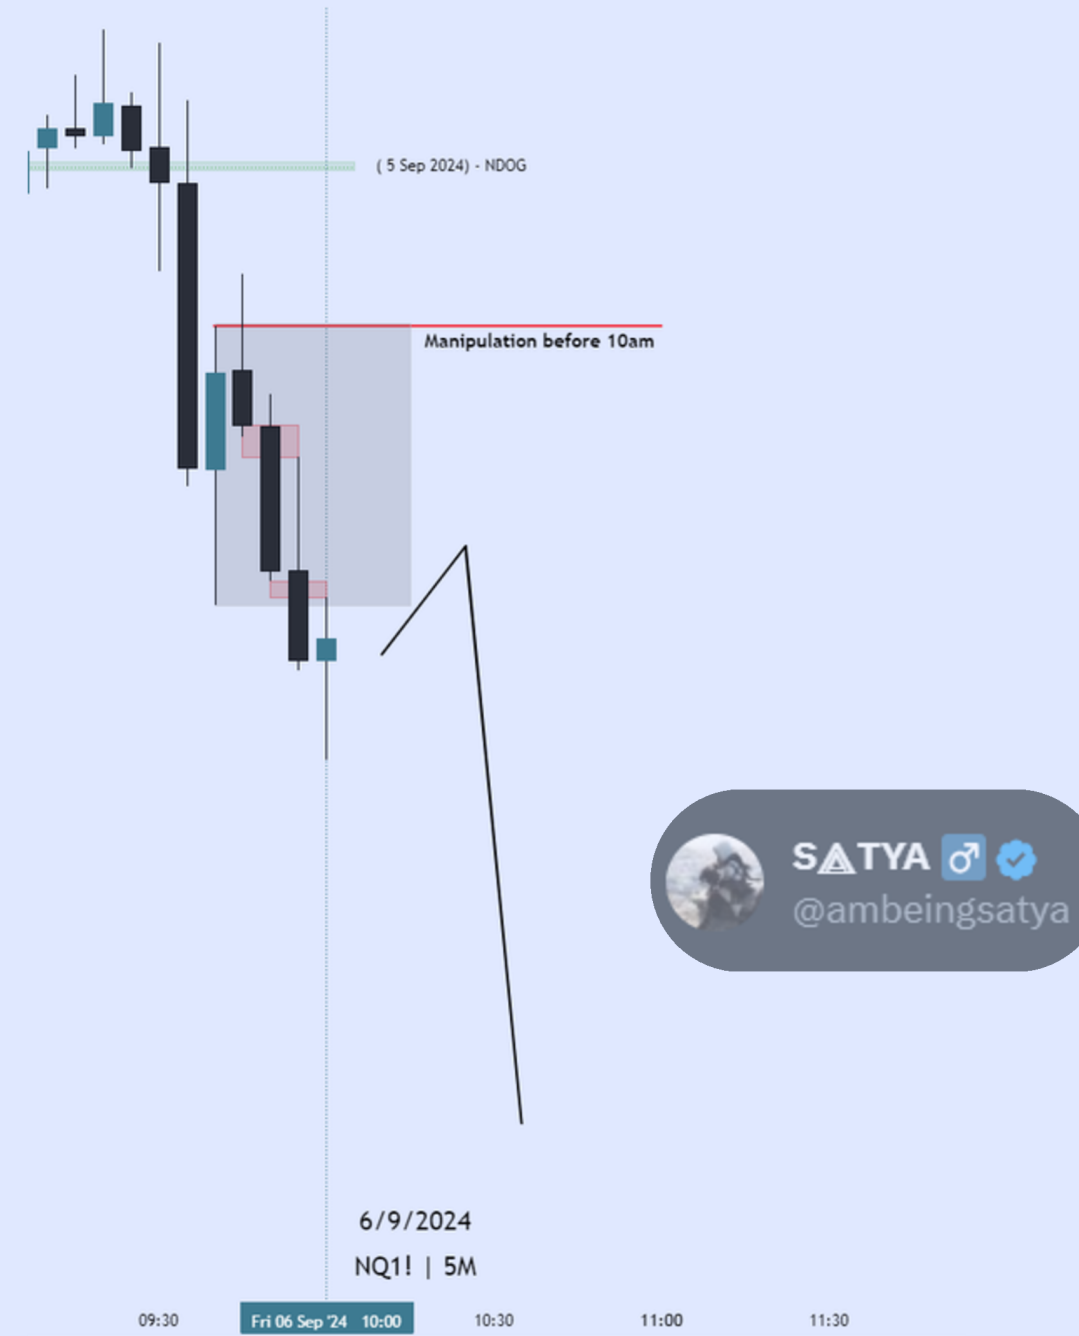

Model 2

Example NQ :- Model 2

- Price Rejecting from the FVA
- HTF manipulation at H4 6am,
- LTF 5min (NQ is volatile so I use 5m instead of 15m)

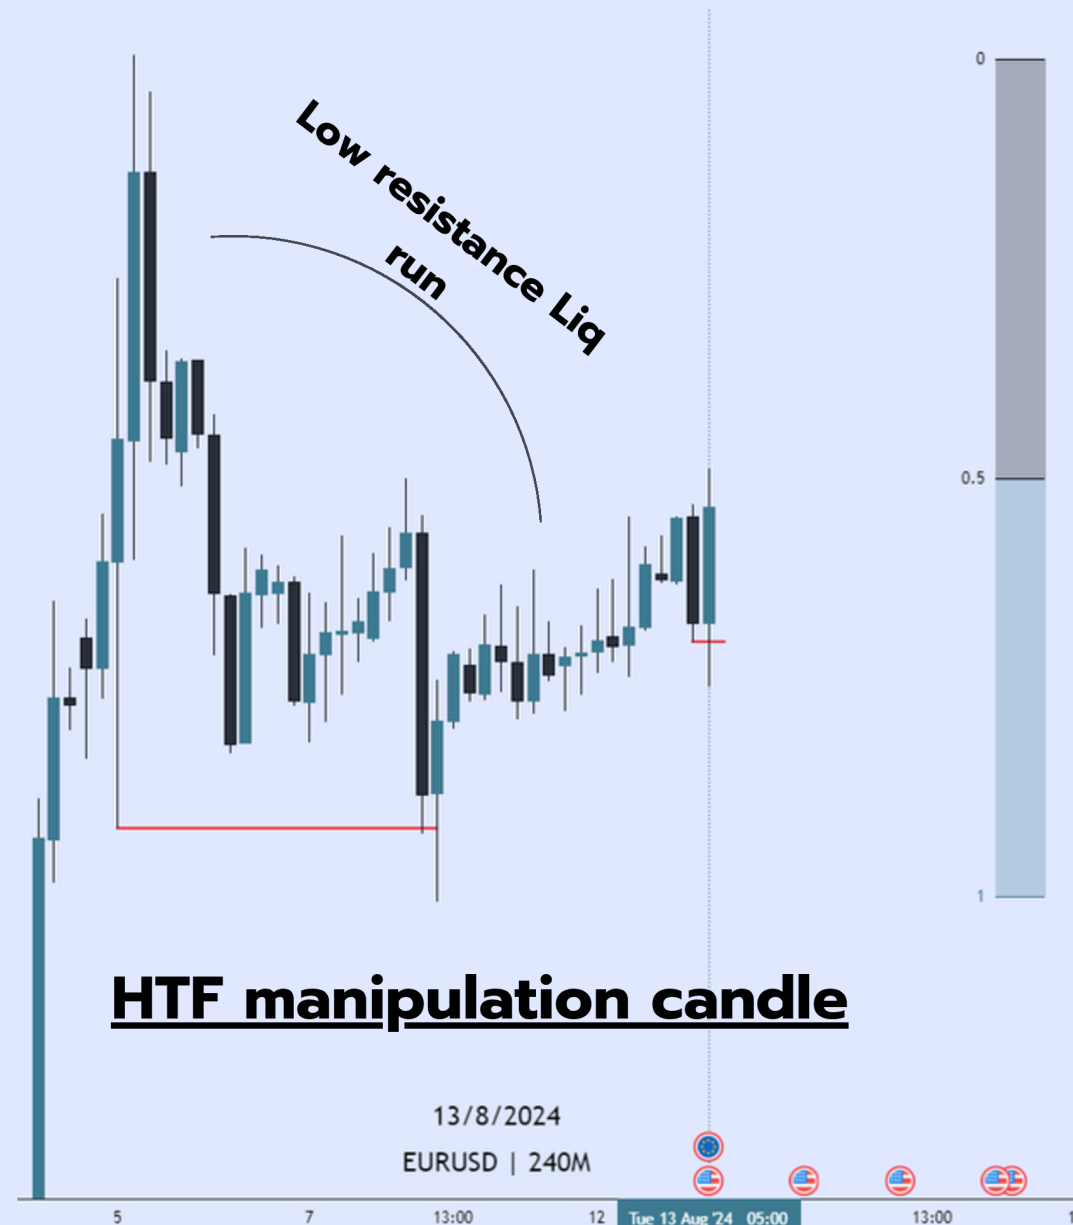

- Before the 10am open , there is liq sweep and FVG is formed it confirms the bearish order flow

- After the 10am, open price taps the order flow.
- plan the 2RR trade -entry & SI as shown above

Example : EURUSD

- HTF manipulation H4 candle formed at the daily discount at 5am (UTC-4)
- There is no unmitigated FVG opposing the bullish order flow.

- As anticipated there is an LRLR bullish order flow.
- Follow any of the 2 entry model in the LTF 15m or 5min as per the volatility.
- I don't expect the retracement into fvg in 15min time frame.
- Enter the trade after the formation of FVG

- Model 2 and model 1 -both can occur, but I mostly prefer the model 1
- Mine: model 1-Because it has high win rate
- Always plan 1:2RR

Points to remember

- Only sell at premium & Buy at the discount.
- Look for manipulation & Entries at the AM session.
- No PM session trades & No trades in Bank holidays.
- Trading manipulation candle along with HTF bias has better win rate.
- If there is LRLR possibility- Higher the win Rate
- Book partials & SL trailing at the 50% of the range.
- Plan the trades after this type of high impact news.
CPI, FOMC, NFP & PPI.
